

# FIRST FIT HEURISTIC FOR THE BIN PACKING PROBLEM.

Items of different sizes

GOAL: fit all items into as few boxes as possible.

Input:  $[ \dots, \dots, \dots, \dots, \dots, \dots ]$   
bin capacity

$\downarrow$   
 $\text{bins} = [ \dots, \dots, \dots, \dots ]$

Some boxes (bins) with a fixed size.

Strategy:  
→ open first bin.  
for each item:

for each open bin:  $\times$

check if item fits in bin.

→ True: place the item, move on to next item.

→ False: move on to next bin.

find available space in bin = capacity  
- size of all items already in the bin.  
keep track!

**X** if item is not placed:  
open new bin, and place item in it.

for bin in bin\_list:  
    bin = bin + 2

for i in range(len(bin\_list)):  
    bin\_list[i] = bin\_list[i] + 2

Lists are mutable.  
= changeable.
